

Lets say you went to a Restaurant

After going through the Menu you made your decision and gave your order

The waiter gets your order to the kitchen where the chefs prepare all your food and send it to you once everything is done, all at once

@codechips

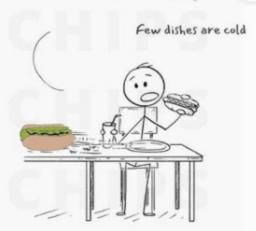

You will get your entire order when everything is done

But what if you want to change your order in between or add something to it

But now I don't want soda, instead I wish for orange juice

@codechips

This would be frustrating, isn't it?

This is true in Software development process too

Developing a Software may take months or years

@codechips

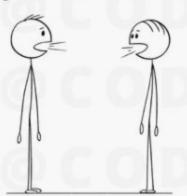

And its hard to determine the entire features in this high demanding world

Initially

1 Year Later

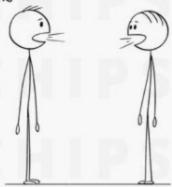

I need an App that can get youtuber's videos and tweets in one place

sure

Can you add a feature to get instagram reels and youtube shorts too

your app is done

@codechips

D Cody

But what if things happend this way

You went to the Restaurant and gave your order

Instead of preparing and presenting in one go, you were provided first with Starters, followed by the main course and finally dessert one by one

@codechips

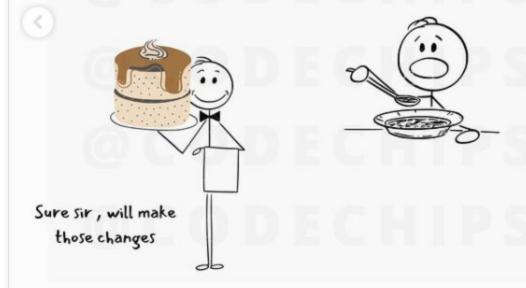

Along with

Focussing on Customer collaboration, Individuals, interactions and good food

> And can I change my dessert to ice cream

Can you make this soup extra spicy

@codechips

D Cody

Now the Restaurant is **Agile**

What does Agile actually mean?

Taking agile in its true definition, being Agile is about being able to understand, adapt, and change quickly in an ever-evolving environment. This, in its simplest form, means that there is no one way to do things.

@codechips

Agile is a **mindset**, that focusses on a **set of values and principles**

- · Individuals and interactions over processes and tools
- · Working Software over comprehensive documentation
- · Customer collaboration over contract negotiation
- · Responding to Changes over following a plan

And 12 principles to satisfy the customer with continuous delivery, changing requirements, working together with better communication

@codechips

Scrum and Kanban are two of the frameworks that are considered to be Agile

Can I also have the option to not pay the bill?

@codechips
